ODNR/Div. Of Water
Dam Safety Program

**RE: Sippo Creek Reservoir Dam
City of Massillon, Stark County
Hydrologic and Hydraulic Report Comments Response
File Number 0614-012**

Dear Mr. Banachowski:

URS Corporation (URS) is pleased to submit the following responses to the ODNR comments regarding the Hydrologic and Hydraulic Report for the Sippo Creek Reservoir Dam for the City of Massillon. This submittal reflects the responses to the H&H comments provided to the City of Massillon on April 4, 2012. URS is providing these services to develop a design discharge for the dam and to bring the dam into compliance with ODNR regulations.

Hydrology and Hydraulics for Sippo Creek Reservoir Watershed and Dam

1. The Dam Safety Engineering Program is in agreement with the methods used in the analysis and results of URS's report.

No response required.

2. Table "A", Breach Input Parameters, showed the normal pool storage to be 61 acre-feet. The normal pool storage based on the conic volume formula for a depth of 15 feet and a surface area of 7.1 acres is 36 acre-feet. The difference in volume is the result of elevation/area data below the normal pool level. Please explain how the elevation/area data below the normal pool level was developed.

Response:

The elevation/area data below the normal pool level was developed from approximated bathymetric contours. The contours were based on a proposed dredge plan to remove sediment accumulated in the reservoir, in an attempt to return the lake to its original depth. The invert of the lake near the dam was estimated to be at the same elevation as the surveyed downstream channel elevation. Interpolated bathometry was developed to approximate the wetted perimeter and area at each elevation below the normal pool. HydroCAD determined the irregular shape's stage/storage relationship from the area and perimeter data. This method provides more accurate storage calculations than does the conic volume equation.

Mr. Keith Banachowski, P.E.
June 21, 2012
Page 2 of 7

3. The State of Ohio has hired a consultant to perform a study to update the Probable Maximum Precipitation (PMP) values for the state. The preliminary results indicate that PMP values will reduce by approximately 25%. This would reduce the Probable Maximum Flood, the design flood for the dam, by a similar percentage.

Response:

Based on the estimated 25% reduction in PMP values, the current 6-hr PMP depth of 26.15 inches will be decreased to an approximate depth of 19.61 inches. Accordingly, the reduction in the PMP depth will result in lowering the existing PMF of 31,970 cfs to 21,087 cfs, which should be accepted as the dam's regulatory design discharge. The lowest acceptable critical flood is the 40-percent PMF, which has been determined to be 5, 227 cfs.

Lincoln Way Flood Routing Analysis

1. The Dam Safety Engineering Program is in agreement with the methods used in the analysis and results of URS's report.

No response required.

2. Page 2-15 states that the maximum capacity of the culvert is approximately 3500 cubic feet per second. Review of the energy grade line for cross section 5409 just upstream of the culvert indicates that the maximum capacity of the culvert is 3000 cubic feet per second. Please address this inconsistency.

Response:

The top of the Lincoln Way Road is at an approximate elevation of 1108.0. In the URS HEC-RAS model, a large entrance loss ($Ke=0.9$) was used to determine the maximum head expected upstream of the embankment, and the minimum capacity of the culvert. The actual entrance loss for the culvert is estimated to be between 0.2-0.4, as shown on the attached Lincoln Way Culvert Comparison Chart. The culvert is an arch box, with 30-75° wingwalls, and square crown. The crown has become rounded by spalling. The actual entrance loss into the culvert is a best estimate. In the HydroCAD model, a much lower entrance loss (0.2) was used to minimize storage behind the embankment, to remain conservative. Using the higher entrance loss in the HEC-RAS model determines worst-case upstream flooding depths. Using a lower entrance loss in the HydroCAD model prevents increased storage from lowering the discharge downstream. Using a conservative Ke value of 0.5 for the culvert, in the HEC-RAS model, shows it has a capacity of approximately 3,350 cfs (see attached Lincoln Way Culvert Comparison Chart). Using an entrance loss value of 0.2 in the HydroCAD model indicates that the capacity of the culvert is approximately 3,480 cfs as shown in the Lincoln Way Culvert Comparison Chart. Using an entrance loss this low in the HEC-RAS model overestimates the capacity of the culvert.

Mr. Keith Banachowski, P.E.
June 21, 2012
Page 4 of 7

There are several important similarities in the two models. The URS and the FIS geometries both used a 1:24,000 topographic contour map, with a 2-foot contour interval. The area has not changed much since the 1982 FIS was performed, although the FIS used a 1970 topographic map, and the URS map was dated 2001. The cross section data should be similar for both models and the 100-year flood area of inundation for both models are similar (albeit the URS model shows lower water surface elevations). The slope of the channel along the Tremont Avenue SE reach in the FIS model appears to be consistent with that of the URS model. However, the invert of several of the cross sections in the FIS model are lower than those used in the URS model. In addition, the Sippo Creek Pressure Conduit is included in both models, but the FIS model appears to over-estimate the pipe's capacity.

It is the opinion of URS that the FIS Manning's' roughness coefficients for the channel and overbank are slightly over-estimated, which yields higher water surface elevations. The FIS model tends to be more conservative than the URS model, which also results in higher water surface elevations. The URS model is more detailed and is likely to have more accurate results than does the Flood Insurance Rate Map shown in the Flood Insurance Study. Neither model is calibrated to actual flood data.

Results and Conclusions

1. The classification of the dam must consider failure of the dam during minor and major flood events. Based on the flood profiles in the FEMA FIS, failure of the dam with a base flow of 800 cubic feet per second (slightly less than the 10-year flood) would have the potential to increase the water surface elevation of East Sippo Creek downstream of Lincoln Way by over three feet. This would likely have significant impact to low-lying homes along Tremont Avenue Southeast. Until the comments provided in this letter have been addressed, this conclusion appears to be valid and the classification of Class I is appropriate.

Response: Based on a dam failure during a discharge approximating the 10-year flood, flows downstream of Tremont Avenue SE would increase from 1,100 cfs to 2,426 cfs as shown on the attached SippoCreek-TremontAve_ComparisonChart. The increased flow would raise flooding depths an additional 1.5 to 2.5 feet through the majority of the reach. However, since the capacity of the Sippo Creek Pressure Conduit would be exceeded during this event, the increased depth of flooding near the conduit would be significantly more in this area.

It is agreed that a dam failure during lesser floods would increase flooding downstream of Lincoln Way. This increase would cause flooding to the houses along Tremont Avenue SE, and could possibly cause a loss of life in the area. Therefore, the appropriate Hazard Classification of the dam is a Class I.

Mr. Keith Banachowski, P.E.
June 21, 2012
Page 5 of 7

2. Based on the submitted analysis and using either the URS or the FEMA flood profiles for East Sippo Creek, it appears that failure of the dam for base floods in excess of 3,000 cubic feet per second would have minimal impact on homes downstream of Lincoln Way.

Response: Agreed. Although the design flood for a Class I dam is the PMF, and the lowest critical flood allowed is 40-percent PMF, this structure has a unique situation in which a failure during a base flood of over 3,000 cfs would have minimal impact on the homes downstream of Lincoln Way. The 40-percent PMF can be proven to be a critical flood as shown on the attached SippoCreek-TremontAve_ComparisonChart. Floods larger than this are also critical floods. There is a flood between the 10-year and the 40-percent PMF that will cause additional flooding downstream of Tremont Avenue SE that would not pass the critical flood criteria. The 10-year flood does not pass the critical flood criteria, and cannot be considered a critical flood. However, it should be considered reasonable to use a design storm of no more than 4,000 cfs for this dam.

3. The submitted analysis considered the existing uneven crest profile of the dam. Any modification of the dam must address leveling the crest. Therefore, the final analysis must provide a proposed uniform crest elevation. Please be aware that the selection of the crest elevation could affect some of the results and conclusions of the submitted analysis.

Response: The feasibility study will address the uneven crest of the dam. All proposed alternative will have a level crest at roughly its current elevation. Based on the H&H analysis, it would appear that the depth of flooding over the dam during extreme floods would preclude using any other method to pass the design flood, other than overtopping protection for the entire dam crest.

URS has provided these responses, which will be incorporated into the URS feasibility study, based on the design discharge once it is approved. There is no tentative start of construction date.

- The current inflow design discharge is the Probable Maximum Flood, which has been determined by URS to be 21,087 cfs, based on a 75 percent reduction in PMP depths.
- Based on the URS revised analyses, the current High Hazard Classification I appears to be the appropriate classification.
- It is the opinion of URS that a critical flood exists, which is smaller than the allowable 40-percent PMF critical flood for a High Hazard Class I dam. The revised 40-percent PMF discharge has been determined to be 5,227 cfs.
- URS requests that the 0.4 PMF smallest critical flood be used as the design flood for the Dam since it is classified as a High Hazard Class Dam.

This was not performed.

Mr. Keith Banachowski, P.E.

Summary for Pond 16P: North Sippo Park- Lincoln Way Culvert

Inflow = 5,296.37 cfs @ 0.02 hrs, Volume= 20,747.155 af
 Outflow = 5,346.03 cfs @ 0.00 hrs, Volume= 20,751.094 af, Atten= 0%, Lag= 0.0 min
 Primary = 3,080.47 cfs @ 0.00 hrs, Volume= 11,495.613 af
 Secondary = 2,383.35 cfs @ 0.51 hrs, Volume= 9,255.482 af

Routing by Sim-Route method, Time Span= 0.00-48.00 hrs, dt= 0.01 hrs
 Starting Elev= 1,009.66' Surf.Area= 14.178 ac Storage= 219.969 af
 Peak Elev= 1,009.71' @ 0.51 hrs Surf.Area= 14.199 ac Storage= 220.660 af (0.691 af above start)
 Flood Elev= 1,008.00' Surf.Area= 13.465 ac Storage= 197.028 af

Plug-Flow detention time= 30.6 min calculated for 20,531.126 af (99% of inflow)
 Center-of-Mass det. time= 0.3 min (1,439.3 - 1,439.0)

Summary for Pond 32P: Constant inflow - 0.40 PMF

Inflow = 5,227.00 cfs @ 0.00 hrs, Volume= 20,735.207 af, Incl. 5,227.00 cfs Base Flow
 Outflow = 5,227.00 cfs @ 3.10 hrs, Volume= 20,735.207 af, Atten= 0%, Lag= 186.2 min
 Primary = 5,227.00 cfs @ 3.10 hrs, Volume= 20,735.207 af

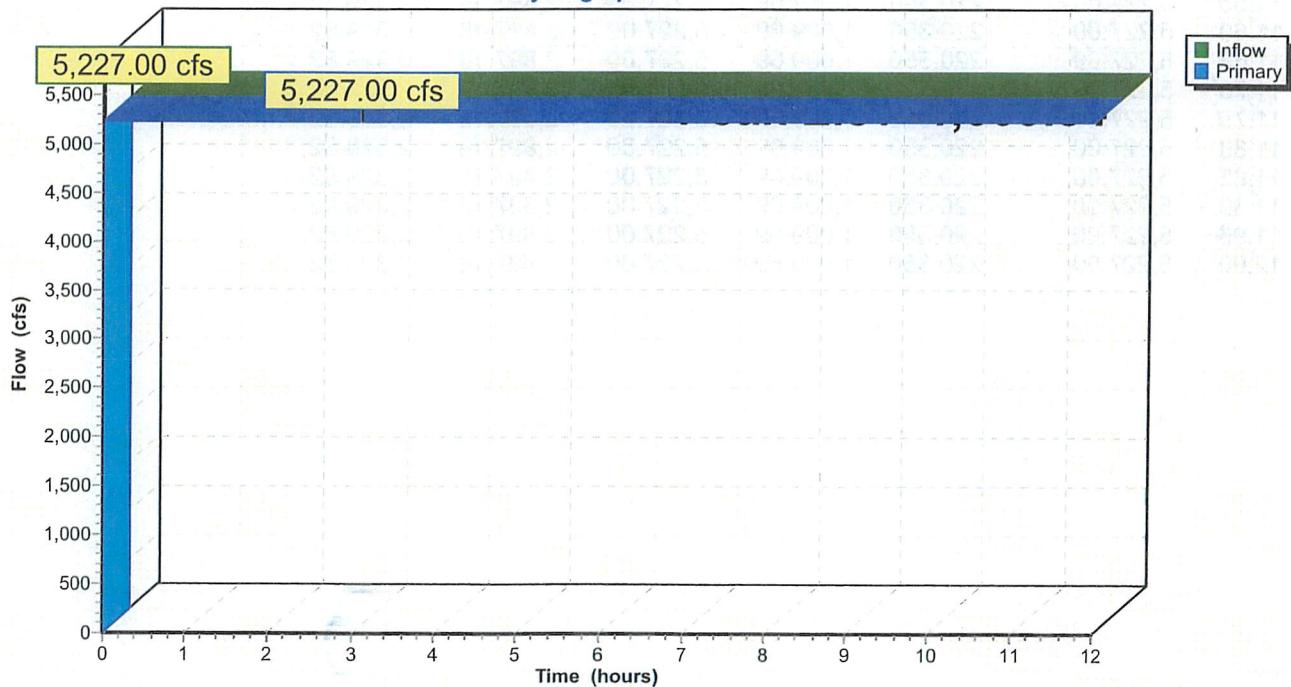

Routing by Sim-Route method, Time Span= 0.00-48.00 hrs, dt= 0.01 hrs
 Peak Elev= 1,009.84' @ 0.52 hrs

Device	Routing	Invert	Outlet Devices
#1	Primary	1,004.20'	500.0' long x 5.0' breadth Broad-Crested Rectangular Weir Head (feet) 0.20 0.40 0.60 0.80 1.00 1.20 1.40 1.60 1.80 2.00 2.50 3.00 3.50 4.00 4.50 5.00 5.50 Coef. (English) 2.34 2.50 2.70 2.68 2.68 2.66 2.65 2.65 2.65 2.65 2.67 2.66 2.68 2.70 2.74 2.79 2.88
