1.3 Nature and Sequence of Construction Activity

General Project Description

The proposed development project is located directly south of Lincoln Way E and centrally between the intersections of Lincoln Way E and 24th/25th streets in the City of Massillon, Ohio. The 2.27-acre project site is bound by Lincoln Way E to the north and is surrounded on all other sides by adjacent residential properties. The existing site is currently vacant/open land consisting of maintained lawn cover. It appears that residential homes may have historically existed on the subject site, but recent aerial photography indicates a consistent use of vacant/open land. The site currently drains overland from north to south with approximately 15 feet of elevation drop occurring from the northern extent of the site to the southern-most portion of the site. Regionally, the general area continues to topographically slope in the southwest direction and is located within the overall watershed of the Tuscarawas River.

The proposed development project involves construction of a new Panda Express quick-serve restaurant and Starbucks coffeehouse with associated site improvements. Site improvements include new paved parking areas, concrete drive-thru lanes, internal sidewalk networks, and new refuse enclosures. The project will result in approximately 2.37 acres of disturbed site area, which includes off-site utility trenching areas. Stormwater from the proposed development will be conveyed via onsite inlets and storm sewer network to a proposed underground detention system that will serve to meet the water quality and quantity requirements set forth by state and local requirements. The underground stormwater detention system will discharge via a new storm sewer connection to the City of Massillon storm sewer network located within 25th street. This system drains south and discharges southeast of McDonald Cir SE which is consistent with the existing overland drainage route.

1.4 Soils, Slopes, Vegetation, and Current Drainage Patterns

Soil type(s):

Site specific soil borings have not yet been completed as of the time of this SWPPP preparation. Web Soil Survey indicates Canfield-Urban Land Complex (2 to 6% slopes) as the primary soil present onsite.

Drainage Patterns:

The site currently drains overland from north to south. The proposed site will drain to an underground stormwater detention system and discharge to the City of Massillon storm sewer network located in 25th street.

Vegetation:

The site is currently a vacant parcel with grass cover.

SECTION 3: GOOD HOUSEKEEPING BMPS

Although sediment is the primary pollutant of concern resulting from construction activity, other pollutants need to be considered as well. These include petrochemicals: fuel, oil, and asphalt; and construction chemicals and materials: paints, solvents, fertilizer, soil additives, concrete wash water, etc. Also included are solid wastes and construction debris. Keeping these substances from polluting runoff can be accomplished to a large extent through good housekeeping and following the manufacturer's recommendations for their use and disposal.

Wastes generated by construction activities (i.e. construction materials such as paints, solvents, fuels, concrete, wood, etc.) must be disposed of in accordance with ORC 3734 and ORC 371 4. Hazardous and toxic substances are used on virtually all construction-sites. Good management of these substances is always needed.

Good erosion and sediment control will prevent some pollutants in addition to sediment from leaving the site; however, pollutants carried in solution or as surface films on runoff water will be carried through most erosion and sediment control practices. These pollutants become nearly impossible to control once carried offsite in runoff. Adding to the problem is the fact that construction wastes, many containing toxic chemicals, are routinely buried on-site, dumped on the ground, poured down a storm drain, or disposed of with construction debris. So while typical erosion and sediment-control practices are important for controlling other pollutants, additional preventative measures are needed.

3.1 Material Handling and Waste Management

1. Educate Construction Personnel, including subcontractors who may use or handle hazardous or toxic materials, making them aware of the following general guidelines:

2. Disposal and Handling of Hazardous and Other Construction Waste

DO:

- Prevent spills
- Use products up
- Follow label directions for disposal
- Remove lids from empty bottles and cans when disposing in trash
- Recycle wastes whenever possible

DON'T:

- Don't pour into waterways, storm drains or onto the ground
- Don't pour down the sink, floor drain or septic tanks
- Don't bury chemicals or containers
- Don't burn chemicals or containers
- Don't mix chemicals together

Always a Better Plan
100 Camelot Drive • Fond du Lac, WI 54935
920.926.9800 • www.excelengineer.com

3. Waste disposal containers shall be provided for the proper collection of all waste material including construction debris, sanitary garbage, petroleum products and any hazardous materials to be used on-site. Containers shall be covered and not leaking. All waste material shall be disposed of at facilities approved for that material. Construction Demolition and Debris (CD&D) waste must be disposed of in accordance with ORC 3714 at an approved Ohio EPA CD&D landfill.

4. No construction related waste materials are to be buried on-site. By exception, clean fill (bricks, hardened concrete, soil) may be utilized in a way that does not encroach upon natural wetlands, streams or their floodplains. Filling of stream side areas is Fill may not result in the contamination of waters of the state unless prohibited by local ordinance or zoning.

5. Construction and Demolition Debris (CD&D) Disposal. CD&D waste must be disposed of in accordance with ORC 3714 at an approved Ohio EPA CD&D landfill. CD&D waste is defined as all materials attached to a structure, which is being demolished. (for materials containing asbestos see Item 12).

6. Handling Construction Chemicals. Mixing, pumping, transferring or other handling of construction chemicals such as fertilizer, lime, asphalt, concrete drying compounds, and all other potentially hazardous materials shall be performed in an area away from any watercourse, ditch or storm drain.

3.2 Establish Proper Building Material Staging Areas

Pollution Prevention Practice

Description

- All construction equipment, maintenance materials, and building materials will be stored in the staging and materials storage areas. Gravel bags shall be installed around the perimeter to designate the staging and material storage areas. Watertight containers will be used to store small tools, parts and other construction materials.
- All building materials such as wood, plastic and glass along with construction scrap materials like brick, wood, steel metal, and pipes, will be kept in a separate covered storage area.
- Hazardous waste materials (oil filters, fuel, paint and equipment fluids, etc) will be stored in a structurally sound and sealed containers in the covered hazardous materials storage area.
- Any large construction materials too large to fit within the covered areas shall be kept in an open materials storage area. These materials shall be elevated on wood blocks to minimize contact with stormwater.

Installation

- Installation of the material storage areas shall happen prior to any infrastructure onsite.

Maintenance Requirements

- Material storage areas shall be inspected weekly and after storm events. Storage areas shall be organized, clean, and have ample cleanup supplies. Any perimeter controls, storage materials, and covers shall be repaired or replaced as necessary to maintain proper function.

3.3 Designated Washout Areas; Equipment/Vehicle Washing

All contractors shall be made aware that Ohio EPA's Construction General Permit only allows the discharge of storm water. Other waste streams/discharges including but not limited to vehicle and/or equipment washing, leachate associated with on-site waste disposal, concrete wash outs, etc are a process wastewater. They are not authorized for discharge under the General Storm Water Permit associated with Construction Activities. All process wastewaters must be collected and properly disposed at an approved disposal facility.

Concrete Wash Water/Wash Outs.
Concrete wash water shall not be allowed to flow to streams, ditches, storm drains, or any other water conveyance. A sump or pit with no potential for discharge shall be constructed if needed to contain concrete wash water. Field tile or other subsurface drainage structures within reach of the sump shall be cut and plugged. For small projects, truck chutes may be rinsed on the lot away from any water conveyances.

Equipment/Vehicle Washing.
Equipment and vehicle washing should be conducted in a manner so that no runoff is generated. At a minimum, wash area soils will be covered with plastic and surrounded by impermeable barriers. Collection devices will be installed to collect runoff. Runoff will be properly disposed at an off-site facility.

3.4 Establish Proper Equipment/Vehicle Fueling and Maintenance Practices

Equipment Fueling and Maintenance, oil changing, etc., shall be performed away from watercourses, ditches or storm drains, in an area designated for that purpose. The designated area shall be equipped for recycling oil and catching spills. Secondary containment shall be provided for all fuel oil storage tanks. These areas must be inspected every seven days and within 2 4 hrs. of a 0.5 inch or greater rain event to ensure there are no exposed materials which would contaminate storm water. Site operators must be aware that Spill Prevention Control and Countermeasures (SPCC) requirements may apply. An SPCC plan is required for sites with one single aboveground tank of 660 gallons or more, accumulative aboveground storage of 1 330 gallons or more, or 42,000 gallons of underground storage. Soils that have become contaminated must be disposed of accordance with Item 8 "Contaminated Soils".

920.926.9800 • www.excelengineer.com

3.5 Spill Prevention and Control Plan

Site operators must be aware that Spill Prevention Control and Countermeasures (SPCC) requirements may apply. An SPCC plan is required for sites with one single aboveground tank of 660 gallons or more, accumulative aboveground storage of 1330 gallons or more, or 42,000 gallons of underground storage. Soils that have become contaminated must be disposed of accordance with "Contaminated Soils" below. Spills on pavement shall be absorbed with sawdust, kitty litter or other absorbent material and disposed of with the trash at a licensed sanitary landfill. Hazardous or industrial wastes such as most solvents, gasoline, oil-based paints, and cement curing compounds require special handling. Spills shall be reported to Ohio EPA (-800-82 -9378). Spills of 25 gallons or more of petroleum products shall be reported to Ohio EPA (1-800-282-9378), the local fire department, and the Local Emergency Planning Committee within 30 min. of the discovery of the release. All spills, which result in contact with waters of the state, must be reported to OHIO EPA's Hotline.

***Contaminated Soils*.** If substances such as oil, diesel fuel, hydraulic fluid, antifreeze, etc. are spilled, leaked, or released onto the soil, the soil should be dug up and disposed of at licensed sanitary landfill or other approved petroleum contaminated soil remediation facility (not a construction/demolition debris landfill). Please be aware that storm water runoff associated with contaminated soils are not authorized under Ohio EPA's General Storm Water Permit associated with

Construction Activities. In the event there are large extensive areas of contaminated soils additional measures above and beyond the conditions of Ohio EPA's General Construction Storm Water Permit will be required. Depending on the extent of contamination, additional treatment and/or collection and disposal may be required. All storm water discharges associated with the contaminated soils must be authorized under an alternate NPDES (National Pollutant Discharge Elimination System) Permit.

3.6 Any Additional BMPs

Open Burning. No materials may be burned which contain rubber, grease, asphalt, or petroleum products such as tires, cars, auto parts, plastics or plastic coated wire. (See OAC 3745-9) Open burning is not allowed in restricted areas. Restricted areas are defined as: 1) within corporation limits; 2) within 1000 feet outside a municipal corporation; and 3) a one mile zone outside of a corporation of 10,000 or more. Outside a restricted area, no open burning can take place within a 1,000 feet of an inhabited building located off the property where the fire is set. Open burning is permissible in a restricted area for the following activities: heating tar, welding and acetylene torches, smudge pots and similar occupational needs, and heating for warmth or outdoor barbeques. Outside of restricted areas, open burning is permissible for landscape wastes (plant material), land-clearing wastes (plant material, with prior written permission from Ohio EPA), and agricultural wastes (material generated by crop, horticultural, or livestock production practices. This includes fence posts and scrap lumber, but not buildings).

100 Camelot Drive • Fond du Lac, WI 54935
920.926.9800 • www.excelengineer.com

Dust Control/Suppressants.
Dust control is required to prevent nuisance conditions. Dust controls must be used in accordance with the manufacturer's specifications and not be applied in a manner, which would result in a discharge to waters of the state. Isolation distances from bridges, catch basins, and other drainage ways must be observed. Application (excluding water) may not occur when precipitation is imminent as noted in the short term forecast. Used oil may not be applied for dust control.

Other Air Permitting Requirements:
All contractors and sub contractors must be made aware that certain activities associated with construction will require air permits. Activities including but not limited to mobile concrete batch plants, mobile asphalt plants, concrete crushers, large generators, etc., will require specific Ohio EPA Air Permits for installation and operation. These activities must seek authorization from the corresponding district of Ohio EPA. Notification for Restoration and Demolition must be submitted to Ohio EPA for all commercial sites to determine if asbestos corrective actions are required.

Vegetated Buffers

Description of BMP

- Vegetated buffers will be provided at the perimeters of the site to slow/filter stormwater. The maximum slopes in the lawn areas will be 4:1. The side slopes of the lawn areas will be vegetated with erosion resistant grasses and erosion control blankets immediately after final grade has been reached. For more information about the design, see the construction plans.

Installation

Maintenance Requirements

- All lawn areas showing signs of erosion, scour, channelization, debris, or sediment shall be repaired, reinforced, and vegetated immediately. Remove any debris and sediment immediately.
- Mowing shall take place no less than twice per year at a height of no less than three inches. Grasses shall not be allowed to grow to a height that permits branching or bending. Mowing shall only take place when the ground is dry and able to support machinery.

Underground Detention System

Description of BMP

- Stormwater from the post-development site will drain via a new onsite storm sewer network to a proposed underground stormwater detention system that will serve to reduce post-development peak flows to the pre-development conditions prior to discharging to the City of Massillon public storm sewer system. The underground detention system will consist of perforated 84" CMP pipe along with associated aggregate bedding and cover material. The voids within the aggregate will also act as temporary stormwater storage for the system. The system will discharge through an outlet control structure consisting of a storm manhole with an internal weir plate. The internal weir plate will have multiple orifice openings at varying elevations to control post-development peak flow rates to the pre-development conditions. See Section 8 and Appendices K-N for design information.

Installation

- The system shall be installed early in the construction process.

Maintenance Requirements

100 Camelot Drive • Fond du Lac, WI 54935
920.926.9800 • www.excelengineer.com

- Standpipes, outlet structures, inlet and outlet pipes, and chambers shall be kept clear of debris at all times. Non-structurally sound devices shall be replaced. Special attention shall be given to the system outlet structure to ensure that orifice openings are clear of debris. These appurtenances shall be inspected semi-annually, in the spring and fall seasons. Follow underground detention system manufacturer's specifications for maintenance procedures. Contractor to remove all sediment and debris from the system prior to completing the storm system installation. Sediment shall be regularly removed from the system in accordance with manufacturers recommendations. 4. ALL PLANTS SHARING SIMILAR HYDROZONE CHARACTERISTICS (WATER NEEDS, SUN EXPOSURE, ETC.) SHALL BE PLACED ON A VALVE DEDICATED TO PROVIDE THE NECESSARY WATER REQUIREMENTS SPECIFIC TO THAT HYDROZONE. THE PLANTING PLAN SHALL BE THE BASIS OF IRRIGATION DESIGN, AND THE IRRIGATION CONTRACTOR SHALL OBTAIN AND THOROUGHLY REVIEW A COPY OF THE PLANTING PLAN PRIOR TO SUBMITTING A BID FOR IRRIGATION DESIGN/BUILD SERVICES.
5. THE IRRIGATION SYSTEM SHALL BE DESIGNED AND INSTALLED, TO THE MAXIMUM EXTENT POSSIBLE, TO CONSERVE WATER BY USING THE FOLLOWING DEVICES AND SYSTEMS: MATCHED PRECIPITATION RATE TECHNOLOGY ON ROTOR AND SPRAY HEADS, RAIN SENSORS, AND MULTI-PROGRAM COMPUTERIZED IRRIGATION CONTROLLERS FEATURING SENSORY INPUT CAPABILITIES.
6. THE DESIGN OF SPRAY AND ROTOR AREAS SHALL ACHIEVE A DISTRIBUTION UNIFORMITY OF 0.7 OR BETTER.

B. SCOPE OF WORK
1. WORK COVERED BY THESE SECTIONS INCLUDES THE FURNISHING AND PAYMENT OF ALL MATERIALS, LABOR, SERVICES, EQUIPMENT, LICENSES, TAXES, FEES, AND ANY OTHER ITEMS THAT ARE NECESSARY FOR THE EXECUTION AND COMPLETION OF ALL WORK, SPECIFIED HEREIN AND/OR SHOWN ON THE IRRIGATION PLANS, NOTES, AND DETAILS.

Re: Approval Under Ohio EPA National Pollutant Discharge Elimination System (NPDES) – Construction Site Stormwater General Permit – OHC000005

Dear Applicant,

Your NPDES Notice of Intent (NOI) application is approved for the following facility/site. Please use your Ohio EPA Facility Permit Number in all future correspondence.

Facility Name:	AKG Development-Massillon-2178020
Facility Location:	Lincoln Way East & 24th Street SE
City:	Massillon
County:	Stark
Ohio EPA Facility Permit Number:	3GC13853*AG
Permit Effective Date:	January 20, 2023
Permit Expiration Date:	April 22, 2023

Please read and review the permit carefully. The permit contains requirements and prohibitions with which you must comply. A copy of the general permit may be viewed or downloaded from here. Coverage under this permit will remain in effect until a renewal of the permit is issued by the Ohio EPA.

If more than one operator (defined in the permit) will be engaged at the site, each operator shall seek coverage under the general permit. Additional operator(s) shall submit a Co-Permittee NOI to be covered under this permit. There is no fee associated with the Co-Permittee NOI form.

Please be aware that this letter only authorizes discharges in accordance with the above referenced General Permit. The placement to fill into regulated waters of the state may require a 401 Water Quality Certification and/or Isolated Wetlands Permit from Ohio EPA. Failure to obtain the required permits in advance is a violation of Ohio Revised Code 6111 and potentially subjects you to enforcement and civil penalties.

If you need assistance or have questions, please call (614) 644-2001 and ask for Construction Site Stormwater General Permit support or visit our website at epa.ohio.gov.

Sincerely,

Anne M Vogel

*** Note:** The permit differentiates between conditions requiring repairs and maintenance, and those requiring corrective action. The permit requires maintenance in order to keep controls in effective operating condition and requires repairs if controls are not operating as intended. Corrective actions are triggered only for specific, more serious conditions, which include: 1) A required stormwater control was never installed, was installed incorrectly, or not in accordance with the requirements in Part 2 and/or 3; 2) You become aware that the stormwater controls you have installed and are maintaining are not effective enough for the discharge to meet applicable water quality standards or applicable requirements in Part 3.1; 3) One of the prohibited discharges in Part 2.3.1 is occurring or has occurred; or 4) EPA requires corrective actions as a result of a permit violation found during an inspection carried out under Part 4.2. If a condition on your site requires a corrective action, you must also fill out a corrective action form found at www.epa.gov/npdes/stormwater/swppp. See Part 5 of the permit for more information.
