

the sanitary sewers on the west side. It is assumed that remedies will be applied.

SUGGESTED CONSTRUCTION PROGRAM

With the construction of a short lateral in Forest Avenue as is contemplated, present city areas can be given sanitary drainage outlet by the construction of the:-

North End Trunk Sewer
Cherry Street Sub Trunk
Woolster Trunk Sewer
Slipco Trunk Sewer
Westmore Street Trunk to Corporation Line.

There is accordingly recommended for present installation the construction of these lines together with the portion of the Tuscarawas Trunk from Cherry St. to below Walnut Street.

The cost of this construction is estimated at \$291,500.

The effect of this construction would be to provide outlet for all portions of the present corporation. Also would be available the means for affording sewerage to outside areas lying east and west of the City, when and as such would be desirable. Disposal of sewage would be into the River at or near the present sewer outlets.

Under this program the completion of the comprehensive plan previously described and as indicated upon accompanying maps may be deferred.

1. Until the existing West Park outlet become over-taxed
2. Until area to the Southeast of the City (Forest Avenue; Area) were included within the City; and
3. Until treatment of the sewerage be required.

This deferred construction will save interest charges upon \$100,500.
